

## Investigation of coeliac disease<sup>1</sup>

1. The sensitivity of the tTG IgA test has not been clearly established in children < 2 years old. Due to lower levels of serum IgA in this age group, the only serological marker of CD may be an AGA IgG test. However, based on a pre-test probability of CD in a normal child of 0.5%, the post-test probability of CD with an isolated positive AGA IgG is only 1–2%.
